No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                               Score

Red Cardinal). High quality mRNA was obtained from flower tissue using a novel adaptation of the 2-butoxyethanol precipitation technique. This was converted to cDNA and screened with a probe generated by PCR amplification (see ANV30328-29). The pRoseKacc7 clone was obtained. 3 Geranium ACC synthase clones (see C pRoseKacc7 clone was obtained. The ACC synthase genes, or their ANV30324-26) are also claimed. The ACC synthase genes, or their fragments, when introduced in antisense orientation under control cof a strong promoter, can be used to genetically modify a plant, cespecially geranium, rose or woody plant. As a consequence, the amount of ACC synthase produced in the plant cells is reduced and the rate of ACC conversion to ethylene decreases. This can be used to prolong the shelf-life of cut flowers and to reduce leaf

(I) are used to express the corresponding polypeptides (II) or to produce genetically modified plant cells or transgenic plants, which may have improved resistance to disease or stress, or altered metabolic/biosynthetic pathways (for production of commercial, nutritional or medicinal products), or generally any trait of interest, or can be used to screen for biologically active agents (e.g. fungicides, reservices agents (e.g. fungicides, reservices agents).

It was obtd. by subjecting broccoli leaf total genomic DNA to PCR using primers (see also AAT33137-38) based on the Arabidopsis thaliana ACS ynthase gene. The product was cloned into PCRII to obtain clone ACCAl. Genomic DNA or cNAM (see also AAT33139) can be inserted, in sense or antisense orientation, into an expression cassette and the transferred to a binary vector suitable for Agrobacterium-mediated plant transformation. The constructs permit control of the level cacc synthase in a transgenic plant (esp. B. oleracea or Cucumis melo) and hence a control of maturation, ageing and shelf-life.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The specification describes methods for introducing localized mutations into target genes in plant cells. The methods comprise using a recombinogenic oligonucleobase comprising 2 regions homologous to a target gene and an intervening mutant region. The methods can be used to introduce localized mutations into target genes to introduce desirable traits, e.g. selective growth advantage under appropriate selective conditions, change in colour of plant cells growing in a callus, herbicide resistance, or improved preservation of fruit or flowers. They can be used in plants such as maize, wheat, rice, lettuce, potato, tomato, canola, soybean or cotton cell. The present sequenc represents

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1-aminocyclopropane-1-carboxylic acid (ACC) synthase enzyme of pineapple. The present invention describes a transgenic variety of pineapple in which initiation of flowering is inhibited, the variety comprising a nucleotide sequence encoding an ACC synthase enzyme where the nucleotide sequence is operably linked, in the sense or antisense orientation, to one or more regulatory nucleotide sequences. The ACC synthase gene can be used to regulate pineapple plant development,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      particularly for inhibiting initiation of flowering. Such plants can then be induced to flower in a narrow spectrum of time which would thereby decrease the spread of fruit maturity within a crop.

The ACC synthase gene can be used to regulate pineapple plant development, particularly for inhibiting initiation of flowering. Such plants can then be induced to flower in a narrow spectrum of time which would thereby decrease the spread of fruit maturity within a crop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (GOLD-)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents the nucleotide sequence encoding a 1-aminocyclopropane-1-carboxylic acid (ACC) synthase enzyme of pineapple. The present invention describes a transgenic variety of pineapple in which initiation of flowering is inhibited, the variety
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated ACC synthase genes from pineapples - used to generate transgenic pineapples in which the natural initiation of flowering is inhibited
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            comprising a nucleotide sequence encoding an ACC synthase enzyme where
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 1; Fig 1; 37pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1-aminocyclopropane carboxylase synthases (ACC synthase) GAC-1 (AAW09878) and GAC-2 (AAW09879), enzymes involved in the biosynthesis of ethylene in plants. In a method for the commercial production of transgenic plants, Agrobacterium vectors carrying antisense genes for ACC synthase or ACC oxidase (see also AAT66248) are used to inoculate petiole explants of a mother plant, prof. pelargonium x domesticum. The resulting callus is cultured and used to regenerate transgenic plants. The antisense genes prevent ACC synthase or ACC oxidase expression and hence ethylene formation and fruit ripening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ACC synthase; 1-aminocyclopropane-1-carboxylate synthase; antisense; ethylene; transgenic plant; Pelargonium x domesticum; in vitro propagation; tissue culture; ripening; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              High quality mRNA was obtained from flower tissue using a novel adaptation of the 2-butoxyethanol precipitation technique. This was converted to cDNA and screened with a probe generated by PCR amplification (see AAV30328-29). The pPHSacc49 clone was obtained. Geranium ACC synthase cDNA clones pHSacc41 (see AAV30324) and pPHSacc44 (see AAV30325), and rose ACC synthase cDNA clone pRoseKacc7 (see AAV30330), are also claimed. These ACC synthase genes, or their fragments, when introduced in antisense orientation under control of a strong promoter, can be used to genetically modify a plant, especially geranium, rose or woody plant. As a consequence, the amount of ACC synthase produced in the plant cells is reduced and the rate of ACC conversion to ethylene decreases. This can be used to prolong the shelf-life of cut flowers and to reduce leaf

                                                                                                                                                                                                                                                                                   This sequence, designated PNACCS2, is a 1-aminocyclopropane-1-carboxylic acid (ACC) synthase gene isolated from poplar trees whice had been exposed to ozone. Exposure conditions were: 0.1 ppm ozone for 6 hours after one hour acclimation at 25 degrees C, 70 % relationality, 30 k lux and air current 30 cm/second. This gene will be useful for breeding air pollutant ozone-resistant trees, especially

                                                                                                                                                                                                                                                                             This sequence, designated PNACCS1, is a 1-aminocyclopropane-1-carboxylic acid (ACC) synthase gene isolated from poplar trees which had been exposed to ozone. Exposure conditions were: 0.1 ppm ozone for 6 hours after one hour acclimation at 25 degrees C. 70 % relative humidity, 30 k lux and air current 30 cm/second. This gene will be useful for breeding air pollutant ozone-resistant trees, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ozone-induced 1-amino:cyclopropane-1-carboxylic acid synthetic enzyme genes - from poplar tree, are useful for generating ozone-resistant trees and pollution clean-up trees

ACC synthase is involved in the pathway for ethylene biosynthesis and the rate of endogenous expression of ACC synthase is considered to limit substantially the rate of ethylene production. Endogenous ethylene is often deleterious to crops, especially if some form of mechanical wounding has occurred and diminishes their post harvest quality and storage life. Novel ACC synthase genes expressed in transgenic plants using either sense or antisense expression system may be used to control

ACC synthase an enzyme involved in the pathway for ethylene biosynthesis and the rate of endogenous expression of ACC synthase is considered to limit substantially the rate of ethylene production. Endogenous ethylene is often deleterious to crops, especially if some form of mechanical wounding has occurred and diminishes their post harvest quality and storage life. Novel ACC synthase genes expressed in transgenic plants using either sense or antisense expression system may be used to control the regulation of plant development, in particular fruit ripening, reducing senescence and thus improving storage life.

                                                                       The sequence represents the coding sequence of 1-aminocyclopropane-1-
CC carboxylic acid synthase (ACS) from banana, used in the method of
CC the invention. The method involves modifying the level of ethylene
CC biosynthesis in a plant of the genus Musa by inserting into the genome of
CC the plant a DNA sequence (1) encoding a banana 1-aminocyclopropane-1
CC carboxylic acid synthase (ACS) or an ethylene-forming enzyme (EFE), where
CC (1) is in sense or antisense configuration, and modifies the level of
CC activity of ACS or EFE. This retards the rate of ripening in banana
CC fruits which reduces the rate of deterioration of banana fruit after
CC harvest. As a result, fruit may be harvested when they have reached
CC partial or full ripeness and still have the robustness to withstand
CC handling and transport to reach the consumer in good condition. In this
CC way high quality ripe fruit can be made available to the consumer with
CC reduced requirement for post-harvest treatment. High quality fruit will
CC have improved flavour and texture. High quality fruit can be produced
CC consistently over a wide harvest period, and such fruit can be held in
CC store for long periods and ripened to optimal quality by the supply of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Qy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      St., Albany, CA 94710, USA
On Feb 29, 2000 this sequence version replaced gi:6453846.
The sequence is of BAC F16917 from Arabidopsis thaliana chromosome
1. The sequence does not represent the sequence of the entire
insert of this clone. It is shorter by 10039 bp because we submit
only the unique sequence of the clone. However, in order to
facilitate the joining of overlapping clones in the future, for
creation of larger contigs, we provide small overlaps (200 bp)
between overlapping sumbitted clones. The 5' end of this sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Direct Submission

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AL Submitted (01-OCT 1999) Takuji Sasaki, National Institute of Agrobiological Resources, Rice Genome Research Program; Kannondai 2-1-2, Tsukuba, Ibaraki 305-8602, Japan (E-mail:tsasaki@abr.affrc.go.jp, URL:http://rgp.dna.affrc.go.jp/, Tel:81-298-38-7441, Fax:81-298-38-7468)

The orientation of the sequence is from T7 to SP6 of the PAC clone. Genes were predicted from the integrated results of the following:GENSCANI.0, BLASTN2.0, BLASTN2.0 as well as SplicePredictor (October1998 version). The genomic sequence was searched against the non-redundant database NRP(PIR, SWISSPROT, GENPEPT, PDB) from MAFF DNAbank and the CDNA sequence database at RGP. Protein similarities of the cording regions were searched against NRP with BLASTP2.0. ESTs represent the identified CDNA sequences using BLASTN2.0 with the corresponding DDBJ accession no.

Genes with similarity to proteins in the databases are described in
'product' or 'note' qualifiers. Genes that have no significant
protein similarity are described as 'unknown protein'.
The software programs used to predict genes include: Grail
(Informatics Group, oak Ridge National Laboratory,
http://compbio.ornl.gov/grail-1.3/),
GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html),
NetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of
Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and
SplicePredictor (Volker Brendel, Stanford University,
http://gremlinl.zcol.iastate.edu/gl-bin/sp.cgi).
Genes encoding trRNas are predicted by tRNAscan-SE
(Sean Eddy, Washington University School of Medicine, St. Louis,
http://genome.wustl.edu/eddy/tRNAscan-SE).

It may be shorter because we remove overlaps between neighboring submissions. The 5' clone is K10D11 and the 3' clone is MJM18.
